

Framework for nintex Automation K2

Manage all your workflow needs
from one place - **GLOBALLY**

The **Framework** for Nintex automation K2 helps you to keep overview and control about all your processes workflows and forms.

The **development work starts here**. Define new processes, define the number forms, the names, the descriptions, the user roles, etc.

Your form will collect the relevant data and transform it based on user, location, language.

Empower the process owners to take control without complex admin knowledge.

What is reserved to admins in K2 Management is possible and securely delegated in Framework.

Minimize admin efforts and leave user management and support to the process owners.

Never change your form or workflow again for just a data you could enter here!

Global Process Administration

This is the central form for process configuration.

Process

Let the framework deal with complexity, the admins,
process owners and users shall have an easy interface

Admin form

- Manage processes incl. control mechanism
- Define and work with change requests
- Create process roles/functions and user assignment
- Define forms, logic and descriptions/help texts
- Create structured categories for developers
- Includes developer guidelines and governance

Process owner form

- Delegated permission to process owner without server admin rights
- Manage role/user assignment
- Create email distribution lists
- Define reminders and repetitions
- Describe help texts and work instructions to users
- Add hyperlinks to internal documents

Management worklist

- Manage user processes
- Forward tasks to deputies
- Release processes directly in list view
- Organize task priorities
- Process error handling 1st level

Application downtime

- Management of process downtime
- Locking forms, workflows and user access during maintenance work
- Ensuring data consistency

Translations

- Management of multi languages by process owner or Keyuser
- Organize translations texts easy and fast
- Generate text modules in different languages for use in workflow emails

User form

- Overview of all processes of a user
- Access user processes
- Overview of all own user tasks
- Release, share and redirect own tasks

Generic workflows

- Error handling workflow
- Go to activity workflow
- Reset workflow status workflow

Manage master data

- Management of process-specific master data for use in forms
- Define dependencies and relationships
